Is It Time to Declare Your Financial Independence?

No matter how much money you have or which life stage you're in, becoming financially independent starts with a dream. Your dream might be to finally pay off the mountain of debt you've accumulated, or to stop

relying on someone else for financial support. Or perhaps your dream is to retire early so you can spend more time with your family, travel the world, or open your own business. Financial independence, however you define it, is freedom from the financial obstacles that are keeping you from living life on your own terms.

Envision the future

If you were to become financially independent, what would change? Would you spend your time differently? Live in another place? What would you own? Would you work part-time? Ultimately, you want to define how you choose to live your life. It's your dream, so there's no wrong answer.

Work at it

Unless you're already wealthy, you may have had moments when winning the lottery seemed like the only way to become financially secure. But your path to financial independence isn't likely to start at your local convenience store's lottery counter.

Though there are many ways to become financially independent, most of them require hard work. And retaining wealth isn't necessarily easy, because wealth may not last if spending isn't kept in check. As income rises, lifestyle inflation is a real concern. Becoming — and remaining — financially independent requires diligently balancing earning, spending, and saving.

Earn more, spend wisely, and save aggressively

Earn more. The bigger the gap between your income and expenses, the quicker it will be to become financially independent, no matter what your goal is. The more you can earn, the more you can potentially save. This might mean

finding a job with a higher salary, working an extra job, or working part-time in retirement. And a job is just one source of income. If you're resourceful and able to put in extra hours, you may also be able to generate regular income in other ways — for example, renting out a garage apartment or starting a side business.

Spend wisely. Look for opportunities to reduce your spending without affecting your quality of life. For the biggest impact, focus on reducing your largest expenses — for example, housing, food, and transportation. Practicing mindful spending can also help you free up more money to save. Before you buy something nonessential, think about how important it is to you and what value it brings to your life so that you don't end up with a garage or attic filled with regrettable purchases.

Save aggressively. Set a wealth accumulation goal and then prioritize saving. Of course, if you have a substantial amount of debt, saving may be somewhat curtailed until that debt is paid off. Take simple steps such as choosing investments that match your goals and time frame, and paying yourself first by automatically investing as much as possible in a retirement savings plan. Time is an important ally in the quest for financial independence, so start saving as early as possible and build your nest egg over time. (Note that all investing involves risk, including the possible loss of principal, and there is no guarantee that any investment strategy will be successful.)

Keep going

Make adjustments. Life changes. Unexpected bills come up. Some years will be tougher financially than others. Expect to make some adjustments to your plan along the way, especially if you have a long-term time frame, but keep going.

Track your progress. Celebrate both small milestones and big victories. Seeing the progress you're making will help you stay motivated as you pursue your dream of financial independence.

Why Not Do It Now? New Research on Procrastination

Advantage of an Early Start

Saving for retirement may be a low priority when you're young, especially if you're earning a low salary. But starting early can make a big difference, as you can see in the accompanying chart.

This hypothetical example of mathematical compounding is used for illustrative purposes only and does not represent the performance of any specific investment. It assumes a monthly deferral of salary and monthly compounding of earnings. Fees, expenses, and taxes were not considered and would reduce the performance shown if they were included. Actual results will vary.

Do you have a tendency to push off important tasks? Do you do things at the last minute, or maybe not do them at all? If so, you're not alone. About one in five adults is a chronic procrastinator.¹

Procrastination can be frustrating in the short term for even the simplest tasks. But it can have far-reaching effects on important activities and decisions such as completing work projects, obtaining medical treatment, and saving for retirement. Recent research offers insights that may be helpful if you or someone you know has a tendency to procrastinate.

Blame the brain

A study using brain scans found that the amygdala, the almond-shaped structure in the temporal lobe of the brain that processes emotions (including fear), was larger in chronic procrastinators, and there were weaker connections between the amygdala and a part of the brain called the dorsal anterior cingulate cortex (DACC). The amygdala warns of potential dangers, and the DACC processes information from the amygdala and decides what action a body will take.²

According to the researchers, procrastinators may feel more anxiety about the potential negative effects of an action and be less able to filter out interfering emotions and distractions. The good news is that it is possible to shrink the amygdala and improve brain connectivity through mindfulness meditation exercises.³

What's important to you?

Another recent study found that people were less likely to procrastinate about tasks that they personally considered important and were within their own control, as opposed to tasks that were assigned to them and/or controlled by others. This is probably not surprising, but it suggests that procrastination may not be a "weakness" but rather a result of personal values and choices.⁴

Tips for procrastinators

Here are a few suggestions that may help overcome a tendency to procrastinate.

Consider the triggers. One researcher found that people are more likely to procrastinate if a task is characterized by one or more of these seven triggers: boring, frustrating, difficult, ambiguous, unstructured, not intrinsically rewarding, or lacking in personal meaning.⁵ You might try to identify the triggers that are holding you back and take steps to address those specific problems. For example, if a task seems too difficult, ambiguous, or unstructured, you could break it down into smaller, more definite, and manageable tasks.

Meet your resistance. If you don't want to work on a task for an hour, determine how long you are willing to work on it. Can you work on it for 30 minutes? What about 15? If you don't want to do it today, what day would be better?

List the costs and benefits. For big projects, such as saving for retirement, make a list of all the negative ways not making progress could affect your life and all the positive outcomes if you were to achieve your objectives. Imagine yourself succeeding.

Take the plunge. Although a big project may seem daunting, getting a start — any start — could reduce the anxiety. This might be just a small first step: a list, a phone call, an email, or some Internet research. For a written project, you might start with a rough draft, knowing you can polish and improve it later.

Forgive yourself. If you've postponed a task, don't waste time feeling guilty. In most cases, "better late than never" really does apply!

Advantage of an Early Start

Molly begins saving at age 25 when she earns a \$40,000 salary, and Kate begins at age 40 when she earns an \$80,000 salary. At age 65, Molly's savings total would be more than 60% higher than Kate's total.

According to the 2018 Senior Report from America's Health Rankings, social isolation is associated with increased mortality, poor health status, and greater use of health-care resources. The risk of social isolation for seniors is highest in Mississippi and Louisiana and lowest in Utah and New Hampshire.

Quiz: How Much Have You Thought About Health and Health-Care Costs in Retirement?

When planning for retirement, it's important to consider a wide variety of factors. One of the most important is health and its associated costs. Thinking about your future health and the rising cost of health care can help you better plan for retirement in terms of both your finances and overall well-being. This quiz can help you assess your current knowledge of health and health-care costs in retirement.

Questions

1. Health-care costs typically rise faster than the rate of inflation.

True.

False.

2. You could need more than \$500,000 just to cover health-care costs in retirement.

True.

False.

3. Medicare covers the costs of long-term care, as well as most other medical costs.

True.

False.

4. The southern, warmer states are generally the healthiest places for seniors to live.

True.

False.

5. If you're concerned about health-care costs in retirement, you can just delay your retirement in order to maintain your employer-sponsored health benefits.

True.

False.

Answers

1. True. The average inflation rate from 2010 to 2017 was less than 2%, while the average spending on prescriptions, doctors, and hospitals grew between 4% and 5%. From 1970 to 2017, annual per-capita out-of-pocket spending on health care grew from about \$600 to approximately \$1,100 (in 2017 dollars).¹

2. True. In 2017, America's Health Rankings projected that a 45-year-old couple retiring in 20 years could need about \$600,000 to cover their health-care costs, excluding the cost of long-term care. The same report projected that about 70% of those age 65 and older will need some form of long-term care services. And according to the Department of Health and Human Services, the average cost of a one-year stay in a nursing home (semi-private room) was \$82,000 in 2016.²

3. False. Original Medicare Parts A and B help cover inpatient hospital care, physicians' visits, preventive care, certain laboratory and rehabilitative services such as physical therapy, and skilled nursing care and home health care that are not long term. Medicare Part D helps cover the cost of prescriptions (within certain guidelines and limits). Medicare does not cover several other costs, including long-term care, dental care, eye exams related to eye glasses, and hearing aids. Seniors may need to purchase additional insurance to cover these and other services not covered by Medicare.³

4. False. Interestingly, America's Health Rankings found that the five healthiest states for seniors were (1) Utah, (2) Hawaii, (3) New Hampshire, (4) Minnesota, and (5) Colorado.⁴

5. Maybe true, maybe false. Many people believe they will work well into their traditional retirement years, both to accumulate as large a nest egg as possible and to take advantage of employer-sponsored health benefits (if offered beyond Medicare age). While this is an admirable goal, you may not be able to control when you actually retire. In a 2018 retirement survey, nearly 70% of workers said they planned to work beyond age 65; 31% said they would retire at age 70 or older. But the reality is that nearly 70% of current retirees retired before age 65. Many of those individuals retired earlier than planned due to a health problem, disability, or other unforeseen hardship.⁵

The bottom line is that while it's hard, if not impossible, to predict your future health needs and health-care costs, it's important to work these considerations into your overall retirement planning strategies. Take steps now to keep yourself healthy — eat right, exercise, get enough sleep, and manage stress. And be sure to account for health-care expenses in your savings and investment strategies.

How long could it take to double your money?

If you're saving for college, retirement, or a large purchase, it can be useful to quickly calculate how an anticipated annual rate of return will affect your money over time. To find out, you can use a mathematical concept known as the Rule of 72. This rule can give you a close approximation of how long it would take for your money to double at any given rate of return, assuming annual compounding.

To use this rule, you simply divide 72 by your anticipated annual rate of return. The result is the approximate number of years it will take for your money to double.

For example, if your anticipated annual rate of return is 6%, you would divide 72 by 6. Your money can be expected to double in about 12 years. But if your anticipated annual rate of return is 8%, then your money can be expected to double in about 9 years.

The Rule of 72 can also be used to determine what rate of return you would need to double your money in a certain number of years. For

example, if you have 12 years to double your money, then dividing 72 by 12 would tell you that you would need a rate of return of 6%.

Another way to use the Rule of 72 is to determine when something will be halved instead of doubled. For example, if you would like to estimate how long it would take for annual inflation to eat into your savings, you could divide 72 by the rate of inflation. For example, if inflation is 3%, then it would take 24 years for your money to be worth half its current value. If inflation jumped to 4%, then it would take only 18 years for your purchasing power to be halved.

Although using a calculator will give you more precise results, the Rule of 72 is a useful shortcut that can help you understand how long it might take to reach a financial goal, and what annual rate of return you might need to get there.
